

Other fossils

We specialize in shells, but when you are tired of them, you can have a look at our small collections of fossil sea-urchins, corals and shark teeth. We also have a very fine Miocene crab from New Zealand.

The man-eating shark has Miocene and Pliocene predecessors. Luckily you won't meet these giants now if you go for a swim.

There is also something for people who are more interested in fossil bones. Pleistocene Mammoth molars from the North sea, a jaw of a cavebear from Austria.

We like to be of assistance to everybody.

Conchological Museum Stichting Schepel Schelp

Kievitdwarstraat 17

Access to the museum

Our museum can only be visited when somebody is available to show you around. You are most welcome, but please make an appointment first by phone.

The museum is in a private home, and because our collections take a lot of space there are only narrow walkways. Therefore we can't receive groups of more than four adults or six children at the same time.
